## Overview

---

Do solar panels use series or parallel connections?

The majority of solar panel systems use both series and parallel connections. Your solar panel installer will usually recommend dividing your panels into two groups, wiring each group in series, then connecting them in parallel.

What is the difference between series and parallel solar panels?

The essential differences between series and parallel wiring of solar panels are reflected in their effects on voltage and current. A series connection can increase the total system voltage while keeping the current constant.

How are solar panels wired to each other?

Solar panels are wired to each other in two different ways: series and parallel. Every solar panel has a negative and positive terminal, just like the batteries you use at home, and how they're connected determines whether your system is in series or parallel.

Should 12V solar panels be wired in series or parallel?

12V solar panels can be wired in either series or parallel, depending on your system requirements. For higher voltage systems, wire them in series to increase the overall voltage. For increased current and better performance under shaded conditions, wire them in parallel.
