## Overview

---

What happens when sunlight falls on a solar panel?

When sunlight falls on the solar panel's surface, the movement of electrons starts. It creates a potential difference or voltage at both terminals of a cell. These cells are connected together in series and parallel, and a collective voltage is obtained, which is called solar panel voltage.

What factors affect solar panel voltage?

Here are some factors that affect the solar panel voltage. The efficiency of a solar panel decides the output voltage. If the efficiency is high, more charge will flow in the cells. It means the voltage or potential difference will also be high.

How does a solar panel voltmeter work?

These cells are connected together in series and parallel, and a collective voltage is obtained, which is called solar panel voltage. If you connect a voltmeter at the terminals of a solar panel under sunlight, you will be able to record open circuit voltage.

How does sunlight affect voltage?

The more the cells, the more will be the voltage. Sunlight is responsible for voltage generation. When there is no sunlight, you will have no voltage at the terminals. But when the intensity of the sunlight is high, you will get maximum voltage. Keep in mind that solar intensity or irradiance varies at different times of the day.
