Energy storage equipment operation power system design

Overview

What is pumped hydroelectric storage (PHS)?

In order to cope with the challenges brought by the large-scale REG integration to the planning and operation of power systems, the deployment of energy storage system (ESS) has become an important and even essential solution. At present, pumped hydroelectric storage (PHS) is the largest and most mature energy storage type applied in power systems.

What is a storage system?

In this regard, storage systems may refer to mass or energy accumulation. In the case of mass, storage systems typically consist of tanks and vessels providing/accumulating raw materials or (intermediate) products. In the case of energy, the nature of the storage system strictly depends on the form of energy.

Why is energy storage important?

Energy storage has become increasingly crucial as more industrial processes rely on renewable power inputs to achieve decarbonization targets and meet stringent environmental standards.

Can energy storage technology be used in power systems?

With the advancement of new energy storage technologies, e.g. chemical batteries and flywheels, in recent years, they have been applied in power systems and their total installed capacity is increasing very fast. The large-scale development of REG and the application of new ESSs in power system are the two backgrounds of this book.
