How does the GPRS module communicate with the wireless base station

Overview

What is GSM GPRS module?

Here, GSM stands for Global System for Mobile Communication and GPRS stands for General Packet Radio Service. A GSM GPRS MODEM comprises of a GSM GPRS Module along with some other components like communication interface (like Serial Communication – RS-232), power supply and some indicators.

What is GPRS & how does it work?

In conclusion, GPRS is a GSM advancement that allows for packet-switched data services in addition to standard voice services. GPRS enables efficient data packet transfer, increased mobility, and cost-effective communication by adding new components such as the SGSN and GGSN while utilizing the current GSM infrastructure.

What is GPRS – general packet radio service (GPRS)?

GPRS or General Packet Radio Service is an extension of the GSM Network. GPRS is an integrated part of the GSM Network which provides an efficient way to transfer data with the same resources as GSM Network. Originally, the data services (like internet, multimedia messaging etc.) in the GSM Network used a circuit – switched connection.

What changes were made to the GSM network to enable GPRS?

Two key changes were made to the GSM network to enable GPRS: the Channel Coding Unit at the BTS was upgraded, and a Packet Control Unit was added at the BSC or between the BSC and MSC. GPRS is a packet-switched wireless data communication technology.
