

Inverter AC overvoltage

Overview

What causes a solar inverter to fail?

The AC voltage overrange is the most common failure of the solar inverter connected with the PV grid system. This is because the grid voltage is not constant and it will change with the changing of the load and current. At the same time, the output voltage of the inverter will be affected by the grid voltage.

Why is my solar inverter causing a voltage rise?

3. The maximum voltage rise between your solar inverter and the grid is above the 2% maximum in the Australian Standard, because the resistance in the cable (including any connections) is too high. If this is the case then the installer should have advised you that your AC cabling to the grid needed upgrading before solar could be installed.

Why does my solar inverter have an AC voltage failure alarm?

Finally, if it is confirmed that the AC wire output terminal voltage is normal but the inverter AC voltage failure alarm still exists, the alarm may be caused by the internal sampling system of the solar inverter and users shall contact the inverter manufacturer to solve the problem.

What if my inverter trips on an 'over voltage' error?

So if your inverter trips on an 'over voltage' error, the voltage where the grid connects in to your inverter has breached one or both of these limits. Note: The standard allows your DNSP to change these limits to suit their local protection requirements.
