Overview

Do I need an inverter size chart?

The need for an inverter size chart first became apparent when researching our DIY solar generator build. Solar generators range in size from small generators for short camping trips to large off-grid power systems for a boat or house. Consequently, inverter sizes vary greatly.

How big should a solar inverter be?

To account for power losses assume an 80 percent efficiency. Your solar inverter should have a similar or slightly higher wattage rating than the DC output of your solar panels (which in this case is 4.5 kW). You can size it between 1.15 and 1.5 times larger. The rule of thumb is to size your inverter 1.25 bigger than your solar array.

Why is the size of a solar inverter important?

The size of a solar inverter is crucial because it determines how much energy can flow to your home and battery at any given time. More specifically, the inverter ensures that enough energy can flow from your solar panels to the grid and load or if installed with a battery, from and to the battery.

What happens if a solar inverter is too small?

Undersized inverters waste energy and wear out faster. If your inverter is too small, excess solar power is lost, and the unit degrades more quickly. Your inverter should match your solar and battery needs. A properly sized inverter ensures efficient charging, discharging, and home power supply. Most UK homes need at least a 5 kW inverter.
