

Solar panels connected in series with inverter

Overview

Why are solar panels wired in series?

Solar panels are wired in series when you want to increase the total voltage in a system. In this configuration, the voltage outputs of all panels add up while the current remains low on a level of what a single solar panel can provide. Connecting solar panels in series increases the total voltage in a system way over the safe level.

Should a solar inverter be wired in series?

Solar inverters may have a minimum operating voltage, so wiring in series allows the system to reach that threshold. When wired in parallel, the amperage increases while the voltage stays the same, allowing you to produce the energy you need without exceeding the inverter's voltage limits.

How to connect two solar panels in series?

To do this wiring, make two sets (pairs) of PV panels and connect them in series. This way, you will have two pairs of solar panels connected in series. Now, connect the two sets of series connected solar panels in parallel as shown in the following fig. Now, you are having four 12V, 10A solar panels connected in series-parallel configuration.

How to connect solar panels to inverter?

Once you have wired your solar panels in the desired configuration, you need to connect them to the inverter using the appropriate connectors and cables. Here are the connection steps to follow: Step 1: Locate the positive and negative terminals of your panel connection and the corresponding DC input terminals of your inverter.

When you connect the positive terminal of one panel to the negative terminal of another panel, you create a series connection. When you connect two or more solar panels like this, it becomes a PV source circuit.
