## Overview

---

Does relative humidity affect the output of a solar photovoltaic (PV)?

This paper presents the impact of relative humidity on the output of a solar Photovoltaic (PV). The relative humidity has influences on the other climate parameter as well as it is affected by them.

How does humidity affect solar power output?

The PV performance parameters were computed by measuring its output voltage and current, amount of solar radiation incident on the panel's surface and its surface temperature by varying humidity levels artificially in the laboratory. From the studies it was observed that with rising humidity levels, solar insolation and panel power output decrease.

Does humidity effect in association of PV panel surface temperature affect solar radiation?

The address of humidity effect in association of PV panel surface temperature is main novelty of the present research work. However, the paper also present variation of solar radiation under the humid zone. This paper is having six different sections in which first section represents the introduction of the paper.

What is the relationship between solar panel temperature and humidity?

However, limited information is available relating the panel temperature with humidity. Humidity is the measure of water contents in the atmospheric air. The presence of humidity in the atmosphere provides a diffraction path to the incoming sunlight . As a consequence of this, the effective solar radiation, reaching the panel surface reduces.
