

String inverter operating voltage

Overview

What is the operating voltage range for a string inverter?

The MPPT operating voltage range for most string inverters is between 80V and 600V, depending on the inverter make and model. The voltage range for Solar MPPT charge controllers is generally much lower and varies from 24V up to 250V. However, several high-voltage models are available which operate up to 600V.

How does a string inverter work?

Most modern string inverters have a multiple power point tracking (MPPT) that operates within a specific voltage range. Checking the minimum voltage does two things: Checking the maximum voltage does two things: Checking the maximum Isc or maximum current does one thing: Checking the maximum connected power is below the inverter's max.

How do you calculate a minimum string length for an inverter?

Once you find this voltage, find the minimum start-up or MPPT voltage for the inverter and calculate the minimum string length. $(\text{Inverter Min Voltage}) / (V_{\text{low}}) = \text{Minimum String Length}$ Ensure that the highest voltage during the lowest temperature is within the inverter's max and near the upper MPPT range.

What happens if a string voltage goes below the inverter?

If the string voltage goes above or below the operating voltage of the inverter, MPPT or other associated equipment, it will severely reduce performance or, in a worst-case scenario, destroy the inverter or even cause a fire. 1. Select your solar panel Can't find your panel?
