What is a 5G base station?

As the world continues its transition into the era of 5G, the demand for faster and more reliable wireless communication is skyrocketing. Central to this transformation are 5G base stations, the backbone of the next-generation network. These base stations are pivotal in delivering the high-speed, low-latency connectivity that 5G promises.

Will 4G base stations be upgraded to non-standalone 5G?

Upgrading 4G base stations by software to non-standalone (NSA) 5G will still require hardware changes. It will act as an interim, but it will still not satisfy the need for true 5G network architecture. The number of base stations needed increases with each generation of mobile technology to support higher levels of data traffic.

Does 5G use more energy than 4G?

In particular, the 5G base station significantly requires more energy compared to the 4G system, especially when higher frequencies are in action. Due to the very short range of millimeter waves, several stations are required for getting complete coverage. This in turn, increases the overall energy consumption.

How much power does a 5G base station use?

Each nation has a different 5G strategy. For 5G, China uses 3.5GHz as the frequency. Then, a 5G base station resembles a 4G system, but it's on a much larger scale. For sub-6GHz in 5G, let's say you have a macro base station. The power levels at the antenna range from 40 watts, 80 watts or 100 watts.
